

Solid Phase Extraction - SPE

Porvair offers a wide range of products for Solid Phase Extraction (SPE). The solved sample can be purified and concentrated to be eluted and then analysed by LC-MS.

P³ Protein Microlute™

Protein 'crashes' out of solution and precipitates directly in each well when acetonitrile is added, thus solving all common problems associated with the CRASH technique of protein clean-up.

- Pre-filter frit at 100 µm traps flocculant particles >100 µm
- Secondary frit traps fine protein particles at <10µm
- The frits are hydrophobic and oleophobic. This retains sample/acetonitrile in the well to allow precipitation of proteins until vacuum is applied.
- Chemically inert filter material minimizes adsorption of samples
- Frit structure prevents breakthrough of protein particles
- PPLR frit consists of co-sintered plastics and chromatography media. The hydrophobic top frit prevents sample passing into the media during mixing.

Microlute™ SLE for viscous liquids

Diatomaceous-Earth is known for its big pore size and a high pore volume as well as high pH-resistance (1 - 13). These characteristics allow to remove hydrophilic contamination with high amounts of protein, phospholipids and salt being retained.

For purification of blood, plasma or serum before LC/MS analysis, environment and nutrition analysis as well as extraction of small amounts of water from hydrophobic solvents.

NEW! Microlute™ CSi and coming soon * Microlute™ CP

Microlute™ CSi and CP take SPE to a new level of performance by enhancing the **reproducibility** of analyte extraction and **recovery** from biological, environmental and chemical samples.

Unlike traditional loose-filled SPE methods, Microlute™ CSi and CP use a hybrid structure, a solid interconnected network of evenly distributed pores combined with the retentive media (see image below). This design enhances the flow-through of samples to maximise interactions between analytes and the solid phase to deliver a reproducible SPE method that excels in performance, cleanliness and sensitivity.

Product range: C18, HLB, SCX and SAX

Format: 96-well plates

Bed Weight: 2 mg or 10 mg each well

Analysis: UHPLC, HPLC, GC, LCMS, GCMS

Applications: Drug research, ADME tox, metabolism, forensic labs, clinical studies

Advantages: Improved flow, greater reproducibility, less solvent use, faster processing and increased confidence

C18/HLB: Retention of neutral compounds through hydrophobic interaction with some retention of polars.

Strong Cation Exchange (SCX): Sulphonic acid functional group on a polymeric base with a pKa of <1 provides a wide pH range for cationic exchange.

Strong Anion Exchange (SAX): Quarternary ammonium chemistry on a polymeric base with a pKa >18 which is ideal for the capture of acidic analytes.
